

## SN65HVD23x 3.3-V CAN Bus Transceivers

### 1 Features

- Single 3.3-V Supply Voltage
- Bus Pins Fault Protection Exceeds  $\pm 36$  V
- Bus Pins ESD Protection Exceeds  $\pm 16$  kV HBM
- Compatible With ISO 11898-2
- GIFT/ICT Compliant
- Data Rates up to 1 Mbps
- Extended  $-7$  V to  $12$  V Common Mode Range
- High-Input Impedance Allows for 120 Nodes
- LVTTTL I/Os are 5-V Tolerant
- Adjustable Driver Transition Times for Improved Emissions Performance
- Unpowered Node Does Not Disturb the Bus
- Low Current Standby Mode,  $200\text{-}\mu\text{A}$  (Typical)
- SN65HVD233: Loopback Mode
- SN65HVD234: Ultra Low Current Sleep Mode
  - $50\text{-nA}$  Typical Current Consumption
- SN65HVD235: Autobaud Loopback Mode
- Thermal Shutdown Protection
- Power up and Down With Glitch-Free Bus Inputs and Outputs
  - High-Input Impedance With Low  $V_{CC}$
  - Monolithic Output During Power Cycling

### 2 Applications

- Industrial Automation, Control, Sensors, and Drive Systems
- Motor and Robotic Control
- Building and Climate Control (HVAC)
- Backplane Communication and Control
- CAN Bus Standards such as CANopen, DeviceNet, CAN Kingdom, ISO 11783, NMEA 2000, SAE J1939

### 3 Description

The SN65HVD233, SN65HVD234, and SN65HVD235 are used in applications employing the controller area network (CAN) serial communication physical layer in accordance with the ISO 11898 standard. As a CAN transceiver, each provides transmit and receive capability between the differential CAN bus and a CAN controller, with signaling rates up to 1 Mbps.

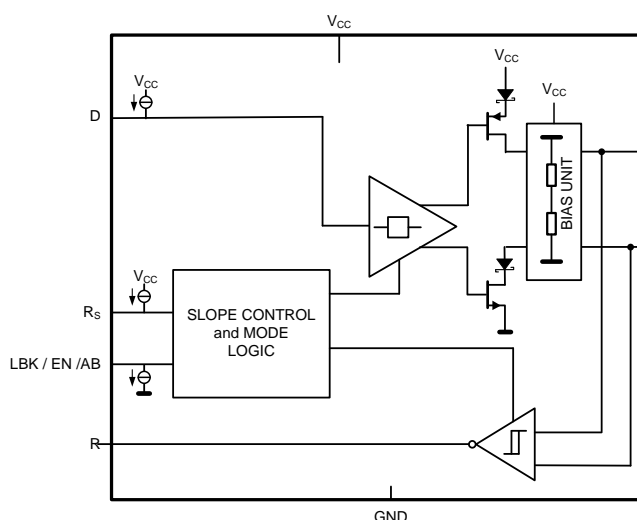

Designed for operation in especially harsh environments, the devices feature cross-wire protection, overvoltage protection up to  $\pm 36$  V, loss of ground protection, overtemperature (thermal shutdown) protection, and common-mode transient protection of  $\pm 100$  V. These devices operate over a wide  $-7$  V to  $12$  V common-mode range. These transceivers are the interface between the host CAN controller on the microprocessor and the differential CAN bus used in industrial, building automation, transportation, and automotive applications.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
SN65HVD233	SOIC (8)	$4.90\text{ mm} \times 3.91\text{ mm}$
SN65HVD234		
SN65HVD235		

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision F (August 2008) to Revision G	Page
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	1
• Changed the Functional Block Diagrams .....	4
• Added the THERMAL SHUTDOWN paragraph to the Application Information section .....	21
• Changed the BUS CABLE paragraph to BUS LOADING, LENGTH AND NUMBER OF NODES paragraph in the Application Information section .....	24
• Added the CAN TERMINATION paragraph to the Application Information section .....	24

Changes from Revision E (October 2007) to Revision F	Page
• Changed <a href="#">Figure 17</a> , Receiver Test Circuit and Voltage Waveform. From: $C_L = 50 \text{ pF} \pm 20\%$ to: $C_L = 15 \text{ pF} \pm 20\%$ .....	13

Changes from Revision D (June 2005) to Revision E	Page
• Added 60- $\Omega$ load test condition to <a href="#">Figure 3</a> .....	10
• Deleted INTEROPERABILITY WITH 5-V CAN SYSTEMS section .....	26
• Added ISO 11898 COMPLIANCE OF SN65HVD230 FAMILY OF 3.3-V CAN TRANSCEIVERS section .....	26

Changes from Revision C (March 2005) to Revision D	Page
• Added Features Bullet: GIFT/ICT Compliant (SN65HVD234) .....	1

**Changes from Revision B (June 2003) to Revision C****Page**

- Added  $I_O$ , Receiver output current to the Abs Max Table ..... 5

**Changes from Revision A (March 2003) to Revision B****Page**

- Changed the data sheet from Product Preview to Production for part number SN65HVD234 and SN65HVD235. .... 1
- Added , Thermal Characteristics ..... 5
- Changed the APPLICATION INFORMATION section..... 23

**Changes from Original (November 2002) to Revision A****Page**

- Changed the data sheet from Product Preview to Production for part number SN65HVD233..... 1

## 5 Description (continued)

**Modes:** The  $R_S$  pin (pin 8) of the SN65HVD233, SN65HVD234, and SN65HVD235 provides three modes of operation: high-speed, slope control, and low-power standby mode. The high-speed mode of operation is selected by connecting pin 8 directly to ground, allowing the driver output transistors to switch on and off as fast as possible with no limitation on the rise and fall slope. The rise and fall slope can be adjusted by connecting a resistor between the  $R_S$  pin and ground. The slope will be proportional to the pin's output current. With a resistor value of 10 k $\Omega$  the device driver will have a slew rate of ~15 V/ $\mu$ s and with a value of 100 k $\Omega$  the device will have ~2.0 V/ $\mu$ s slew rate. For more information about slope control, refer to [Feature Description](#).

The SN65HVD233, SN65HVD234, and SN65HVD235 enter a low-current standby (listen only) mode during which the driver is switched off and the receiver remains active if a high logic level is applied to the  $R_S$  pin. If the local protocol controller needs to transmit a message to the bus it will have to return the device to either high-speed mode or slope control mode via the  $R_S$  pin.

**Loopback (SN65HVD233):** A logic high on the loopback (LBK) pin (pin 5) of the SN65HVD233 places the bus output and bus input in a high-impedance state. Internally, the D to R path of the device remains active and available for driver to receiver loopback that can be used for self-diagnostic node functions without disturbing the bus. For more information on the loopback mode, refer to [Feature Description](#).

**Ultra Low-Current Sleep (SN65HVD234):** The SN65HVD234 enters an ultra low-current sleep mode in which both the driver and receiver circuits are deactivated if a low logic level is applied to EN pin (pin 5). The device remains in this sleep mode until the circuit is reactivated by applying a high logic level to pin 5.

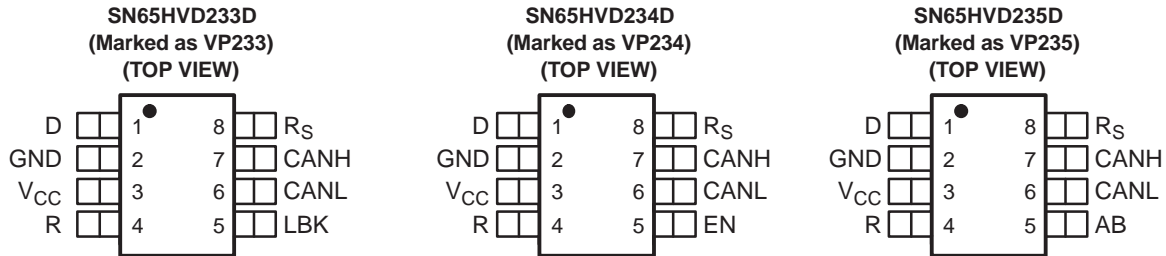

**Autobaud Loopback (SN65HVD235):** The AB pin (pin 5) of the SN65HVD235 implements a bus listen-only loopback feature which allows the local node controller to synchronize its baud rate with that of the CAN bus. In autobaud mode, the bus output of the driver is placed in a high-impedance state while the bus input of the receiver remains active. There is an internal D pin to R pin loopback to assist the controller in baud rate detection, or the autobaud function. For more information on the autobaud mode, refer to [Feature Description](#).

## 6 Device Options<sup>(1)</sup>

PART NUMBER	LOW POWER MODE	SLOPE CONTROL	DIAGNOSTIC LOOPBACK	AUTOBAUD LOOPBACK
SN65HVD233D	200- $\mu$ A standby mode	Adjustable	Yes	No
SN65HVD234D	200- $\mu$ A standby mode or 50-nA sleep mode	Adjustable	No	No
SN65HVD235D	200- $\mu$ A standby mode	Adjustable	No	Yes

(1) For the most current package and ordering information, see [Mechanical, Packaging, and Orderable Information](#), or see the TI web site at [www.ti.com](http://www.ti.com).

## 7 Pin Configuration and Functions

### Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
D	1	I	CAN transmit data input (LOW for dominant and HIGH for recessive bus states), also called TXD, driver input
GND	2	GND	Ground connection
V <sub>CC</sub>	3	Supply	Transceiver 3.3-V supply voltage
R	4	O	CAN receive data output (LOW for dominant and HIGH for recessive bus states), also called RXD, receiver output
LBK	5	I	SN65HVD233: Loopback mode input pin
EN		I	SN65HVD234: Enable input pin. Logic high for enabling a normal mode (high speed or slope control) mode. Logic low for sleep mode.
AB		I	SN65HVD235: Autobaud loopback mode input pin
CANL	6	I/O	Low level CAN bus line
CANH	7	I/O	High level CAN bus line
R <sub>S</sub>	8	I	Mode select pin: strong pulldown to GND = high speed mode, strong pullup to V <sub>CC</sub> = low power mode, 10-kΩ to 100-kΩ pulldown to GND = slope control mode

## 8 Specifications

### 8.1 Absolute Maximum Ratings<sup>(1)(2)</sup>

over operating free-air temperature range unless otherwise noted

	MIN	MAX	UNIT
V <sub>CC</sub> Supply voltage	−0.3	7	V
Voltage at any bus terminal (CANH or CANL)	−36	36	V
Voltage input, transient pulse, CANH and CANL, through 100 Ω (see Figure 18)	−100	100	V
V <sub>I</sub> Input voltage, (D, R <sub>S</sub> , EN, LBK, AB)	−0.5	7	V
V <sub>O</sub> Output voltage	−0.5	7	V
I <sub>O</sub> Receiver output current	−10	10	mA
Continuous total power dissipation	See <a href="#">Power Dissipation Ratings</a>		
T <sub>J</sub> Operating junction temperature		150	°C
T <sub>stg</sub> Storage temperature		125	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Recommended Operating Conditions](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values, except differential I/O bus voltages, are with respect to network ground pin.

## 8.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	CANH, CANL and GND	±16000	V
		All pins	3000	
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>		±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 8.3 Recommended Operating Conditions

			MIN	MAX	UNIT
$V_{CC}$	Supply voltage		3	3.6	V
	Voltage at any bus terminal (separately or common mode)		−7	12	
$V_{IH}$	High-level input voltage	D, EN, AB, LBK	2	5.5	
$V_{IL}$	Low-level input voltage	D, EN, AB, LBK	0	0.8	
$V_{ID}$	Differential input voltage between CANH and CANL		−6	6	kΩ
	Resistance from $R_S$ to ground		0	100	
$V_{I(RS)}$	Input Voltage at $R_S$ for standby		0.75 $V_{CC}$	5.5	V
$I_{OH}$	High-level output current	Driver	−50		mA
		Receiver	−10		
$I_{OL}$	Low-level output current	Driver		50	mA
		Receiver		10	
$T_J$	Operating junction temperature	HVD233, HVD234, HVD235		150	°C
$T_A$	Operating free-air temperature <sup>(1)</sup>	HVD233, HVD234, HVD235	−40	125	°C

(1) Maximum free-air temperature operation is allowed as long as the device maximum junction temperature is not exceeded.

## 8.4 Thermal Information

over operating free-air temperature range (unless otherwise noted)

PARAMETERS		TEST CONDITIONS	VALUE	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance <sup>(1)</sup>	Low-K <sup>(2)</sup> board, no air flow	185	°C/W
		High-K <sup>(3)</sup> board, no air flow	101	
$R_{\theta JB}$	Junction-to-board thermal resistance	High-K <sup>(3)</sup> board, no air flow	82.8	°C/W
$R_{\theta JC}$	Junction-to-case thermal resistance		26.5	°C/W
$P_{(AVG)}$	Average power dissipation	$R_L = 60 \Omega$ , $R_S$ at 0 V, input to D a 1-MHz 50% duty cycle square wave $V_{CC}$ at 3.3 V, $T_A = 25^\circ\text{C}$	36.4	mW
$T_{(SD)}$	Thermal shutdown junction temperature		170	°C

(1) See [SZZA003](#) for an explanation of this parameter.

(2) JESD51-3 low effective thermal conductivity test board for leaded surface mount packages.

(3) JESD51-7 high effective thermal conductivity test board for leaded surface mount packages.

## 8.5 Power Dissipation Ratings

PACKAGE	CIRCUIT BOARD	$T_A \leq 25^\circ\text{C}$ POWER RATING	DERATING FACTOR <sup>(1)</sup> ABOVE $T_A = 25^\circ\text{C}$	$T_A = 85^\circ\text{C}$ POWER RATING	$T_A = 125^\circ\text{C}$ POWER RATING
D	Low-K	596.6 mW	5.7 mW/°C	255.7 mW	28.4 mW
D	High-K	1076.9 mW	10.3 mW/°C	461.5 mW	51.3 mW

(1) This is the inverse of the junction-to-ambient thermal resistance when board-mounted and with no air flow.

## 8.6 Electrical Characteristics: Driver

over operating free-air temperature range (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
$V_{O(D)}$	Bus output voltage (Dominant)	CANH	D at 0 V, $R_S$ at 0 V, See <a href="#">Figure 12</a> and <a href="#">Figure 13</a>	2.45		$V_{CC}$	V
		CANL		0.5		1.25	
$V_O$	Bus output voltage (Recessive)	CANH	D at 3 V, $R_S$ at 0 V, See <a href="#">Figure 12</a> and <a href="#">Figure 13</a>		2.3		V
		CANL			2.3		
$V_{OD(D)}$	Differential output voltage (Dominant)		D at 0 V, $R_S$ at 0 V, See <a href="#">Figure 12</a> and <a href="#">Figure 13</a>	1.5	2	3	V
			D at 0 V, $R_S$ at 0 V, See <a href="#">Figure 13</a> and <a href="#">Figure 14</a>	1.2	2	3	
$V_{OD}$	Differential output voltage (Recessive)		D at 3 V, $R_S$ at 0 V, See <a href="#">Figure 12</a> and <a href="#">Figure 13</a>	–120		12	mV
			D at 3 V, $R_S$ at 0 V, No Load	–0.5		0.05	V
$V_{OC(pp)}$	Peak-to-peak common-mode output voltage		See <a href="#">Figure 21</a>		1		V
$I_{IH}$	High-level input current	D, EN, LBK, AB	D = 2 V or EN = 2 V or LBK = 2 V or AB = 2 V	–30		30	$\mu$ A
$I_{IL}$	Low-level input current	D, EN, LBK, AB	D = 0.8 V or EN = 0.8 V or LBK = 0.8 V or AB = 0.8 V	–30		30	$\mu$ A
$I_{OS}$	Short-circuit output current		$V_{CANH} = -7$ V, CANL Open, See <a href="#">Figure 26</a>	–250			mA
			$V_{CANH} = 12$ V, CANL Open, See <a href="#">Figure 26</a>			1	
			$V_{CANL} = -7$ V, CANH Open, See <a href="#">Figure 26</a>	–1			
			$V_{CANL} = 12$ V, CANH Open, See <a href="#">Figure 26</a>			250	
$C_O$	Output capacitance		See receiver input capacitance				
$I_{IRs(s)}$	$R_S$ input current for standby		$R_S$ at 0.75 $V_{CC}$	–10			$\mu$ A
$I_{CC}$	Supply current	Sleep	EN at 0 V, D at $V_{CC}$ , $R_S$ at 0 V or $V_{CC}$		0.05	2	$\mu$ A
		Standby	$R_S$ at $V_{CC}$ , D at $V_{CC}$ , AB at 0 V, LBK at 0 V, EN at $V_{CC}$		200	600	
		Dominant	D at 0 V, No Load, AB at 0 V, LBK at 0 V, $R_S$ at 0 V, EN at $V_{CC}$			6	mA
		Recessive	D at $V_{CC}$ , No Load, AB at 0 V, LBK at 0 V, $R_S$ at 0 V, EN at $V_{CC}$			6	

(1) All typical values are at 25°C and with a 3.3-V supply.

## 8.7 Electrical Characteristics: Receiver

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
V <sub>IT+</sub>	Positive-going input threshold voltage	AB at 0 V, LBK at 0 V, EN at V <sub>CC</sub> , See <a href="#">Table 1</a>		750	900	mV
V <sub>IT-</sub>	Negative-going input threshold voltage		500	650		
V <sub>hys</sub>	Hysteresis voltage (V <sub>IT+</sub> – V <sub>IT-</sub> )			100		
V <sub>OH</sub>	High-level output voltage	I <sub>O</sub> = –4 mA, See <a href="#">Figure 17</a>	2.4			V
V <sub>OL</sub>	Low-level output voltage	I <sub>O</sub> = 4 mA, See <a href="#">Figure 17</a>			0.4	
I <sub>I</sub>	Bus input current	CANH or CANL at 12 V	150		500	μA
		CANH or CANL at 12 V, V <sub>CC</sub> at 0 V	200		600	
		CANH or CANL at –7 V	–610		–150	
		CANH or CANL at –7 V, V <sub>CC</sub> at 0 V	–450		–130	
C <sub>I</sub>	Input capacitance (CANH or CANL)	Pin-to-ground, V <sub>I</sub> = 0.4 sin (4E6πt) + 0.5 V, D at 3 V, AB at 0 V, LBK at 0 V, EN at V <sub>CC</sub>		40		pF
C <sub>ID</sub>	Differential input capacitance	Pin-to-pin, V <sub>I</sub> = 0.4 sin (4E6πt) + 0.5 V, D at 3 V, AB at 0 V, LBK at 0 V, EN at V <sub>CC</sub>		20		
R <sub>ID</sub>	Differential input resistance	D at 3 V, AB at 0 V, LBK at 0 V, EN at V <sub>CC</sub>	40		100	kΩ
R <sub>IN</sub>	Input resistance (CANH or CANL) to ground		20		50	
I <sub>CC</sub>	Supply current	Sleep EN at 0 V, D at V <sub>CC</sub> , R <sub>S</sub> at 0 V or V <sub>CC</sub>		0.05	2	μA
		Standby R <sub>S</sub> at V <sub>CC</sub> , D at V <sub>CC</sub> , AB at 0 V, LBK at 0 V, EN at V <sub>CC</sub>		200	600	
		Dominant D at 0 V, No Load, R <sub>S</sub> at 0 V, LBK at 0 V, AB at 0 V, EN at V <sub>CC</sub>			6	mA
		Recessive D at V <sub>CC</sub> , No Load, R <sub>S</sub> at 0 V, LBK at 0 V, AB at 0 V, EN at V <sub>CC</sub>			6	

(1) All typical values are at 25°C and with a 3.3-V supply.

## 8.8 Switching Characteristics: Driver

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
t <sub>PLH</sub>	Propagation delay time, low-to-high-level output	R <sub>S</sub> at 0 V, See <a href="#">Figure 15</a>		35	85	ns
		R <sub>S</sub> with 10 kΩ to ground, See <a href="#">Figure 15</a>		70	125	
		R <sub>S</sub> with 100 kΩ to ground, See <a href="#">Figure 15</a>		500	870	
t <sub>PHL</sub>	Propagation delay time, high-to-low-level output	R <sub>S</sub> at 0 V, See <a href="#">Figure 15</a>		70	120	ns
		R <sub>S</sub> with 10 kΩ to ground, See <a href="#">Figure 15</a>		130	180	
		R <sub>S</sub> with 100 kΩ to ground, See <a href="#">Figure 15</a>		870	1200	
t <sub>sk(p)</sub>	Pulse skew ( t <sub>PHL</sub> – t <sub>PLH</sub>  )	R <sub>S</sub> at 0 V, See <a href="#">Figure 15</a>		35		ns
		R <sub>S</sub> with 10 kΩ to ground, See <a href="#">Figure 15</a>		60		
		R <sub>S</sub> with 100 kΩ to ground, See <a href="#">Figure 15</a>		370		
t <sub>r</sub>	Differential output signal rise time	R <sub>S</sub> at 0 V, See <a href="#">Figure 15</a>	20		70	ns
t <sub>f</sub>	Differential output signal fall time		20		70	
t <sub>r</sub>	Differential output signal rise time	R <sub>S</sub> with 10 kΩ to ground, See <a href="#">Figure 15</a>	30		135	ns
t <sub>f</sub>	Differential output signal fall time		30		135	
t <sub>r</sub>	Differential output signal rise time	R <sub>S</sub> with 100 kΩ to ground, See <a href="#">Figure 15</a>	350		1400	ns
t <sub>f</sub>	Differential output signal fall time		350		1400	
t <sub>en(s)</sub>	Enable time from standby to dominant	See <a href="#">Figure 19</a> and <a href="#">Figure 20</a>		0.6	1.5	μs
t <sub>en(z)</sub>	Enable time from sleep to dominant			1	5	

(1) All typical values are at 25°C and with a 3.3-V supply.

## 8.9 Switching Characteristics: Receiver

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
$t_{PLH}$	Propagation delay time, low-to-high-level output	See <a href="#">Figure 17</a>		35	60	ns
$t_{PHL}$	Propagation delay time, high-to-low-level output			35	60	
$t_{sk(p)}$	Pulse skew ( $ t_{PHL} - t_{PLH} $ )			7		
$t_r$	Output signal rise time			2	5	
$t_f$	Output signal fall time			2	5	

(1) All typical values are at 25°C and with a 3.3-V supply.

## 8.10 Switching Characteristics: Device

over operating free-air temperature range (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
$t_{(LBK)}$	Loopback delay, driver input to receiver output	HVD233	See <a href="#">Figure 23</a>		7.5	12	ns
$t_{(AB1)}$	Loopback delay, driver input to receiver output	HVD235	See <a href="#">Figure 24</a>		10	20	ns
$t_{(AB2)}$	Loopback delay, bus input to receiver output		See <a href="#">Figure 25</a>		35	60	ns
$t_{(loop1)}$	Total loop delay, driver input to receiver output, recessive to dominant		$R_S$ at 0 V, See <a href="#">Figure 22</a>		70	135	ns
			$R_S$ with 10 k $\Omega$ to ground, See <a href="#">Figure 22</a>		105	190	
			$R_S$ with 100 k $\Omega$ to ground, See <a href="#">Figure 22</a>		535	1000	
$t_{(loop2)}$	Total loop delay, driver input to receiver output, dominant to recessive		$R_S$ at 0 V, See <a href="#">Figure 22</a>		70	135	ns
			$R_S$ with 10 k $\Omega$ to ground, See <a href="#">Figure 22</a>		105	190	
			$R_S$ with 100 k $\Omega$ to ground, See <a href="#">Figure 22</a>		535	1000	

(1) All typical values are at 25°C and with a 3.3-V supply.

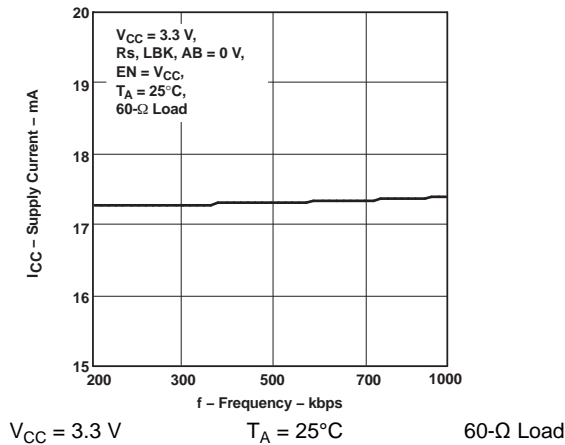

## 8.11 Typical Characteristics

 $R_s, LBK, AB = 0\text{ V}; EN = V_{CC}$ 

**Figure 1. Recessive-to-Dominant Loop Time vs Free-Air Temperature**

## 10 Detailed Description

### 10.1 Overview

This family of CAN transceivers is compatible with the ISO11898-2 High-Speed CAN (controller area network) physical layer standard. They are designed to interface between the differential bus lines in CAN and the CAN protocol controller at data rates up to 1 Mbps.

### 10.2 Functional Block Diagrams

**Figure 29. SN65HVD33 Functional Block Diagram**

**Figure 30. SN65HVD34 Functional Block Diagram**

**Figure 31. SN65HVD35 Functional Block Diagram**

### 10.3 Feature Description

#### 10.3.1 Diagnostic Loopback (SN65HVD233)

The diagnostic loopback or internal loopback function of the SN65HVD233 is enabled with a high-level input on pin 5, LBK. This mode disables the driver output while keeping the bus pins biased to the recessive state. This mode also redirects the D data input (transmit data) through logic to the received data output pin), thus creating an internal loopback of the transmit to receive data path. This mimics the loopback that occurs normally with a CAN transceiver because the receiver loops back the driven output to the R (receive data) pin. This mode allows the host protocol controller to input and read back a bit sequence or CAN messages to perform diagnostic routines without disturbing the CAN bus. A typical CAN bus application is displayed in [Figure 36](#).

## Feature Description (continued)

If the LBK pin is not used it may be tied to ground (GND). However, it is pulled low internally (defaults to a low-level input) and may be left open if not in use.

### 10.3.2 Autobaud Loopback (SN65HVD235)

The autobaud loopback mode of the SN65HVD235 is enabled by placing a high level input on pin 5, AB. In autobaud mode, the driver output is disabled, thus blocking the D pin to bus path and the bus transmit function of the transceiver. The bus pins remain biased to recessive. The receiver to R pin path or the bus receive function of the device remains operational, allowing bus activity to be monitored. In addition, the autobaud mode adds an internal logic loopback path from the D pin to R pin so the local node may transmit to itself in sync with bus traffic while not disturbing messages on the bus. Thus if the local node's CAN controller generates an error frame, it is not transmitted to the bus, but is detected only by the local CAN controller. This is especially helpful to determine if the local node is set to the same baud rate as the network, and if not adjust it to the network baud rate (autobaud detection).

Autobaud detection is best suited to applications that have a known selection of baud rates. For example, a popular industrial application has optional settings of 125 kbps, 250 kbps, or 500 kbps. Once the SN65HVD235 is placed into autobaud loopback mode the application software could assume the first baud rate of 125 kbps. It then waits for a message to be transmitted by another node on the bus. If the wrong baud rate has been selected, an error message is generated by the local CAN controller because the sample times will not be at the correct time. However, because the bus-transmit function of the device has been disabled, no other nodes receive the error frame generated by this node's local CAN controller.

The application would then make use of the status register indications of the local CAN controller for message received and error warning status to determine if the set baud rate is correct or not. The warning status indicates that the CAN controller error counters have been incremented. A message received status indicates that a good message has been received. If an error is generated, the application would then set the CAN controller with the next possibly valid baud rate, and wait to receive another message. This pattern is repeated until an error free message has been received, thus the correct baud rate has been selected. At this point the application would place the SN65HVD235 in a normal transmitting mode by setting pin 5 to a low-level, thus enabling bus-transmit and bus-receive functions to normal operating states for the transceiver.

If the AB pin is not used it may be tied to ground (GND). However, it is pulled low internally (defaults to a low-level input) and may be left open if not in use.

### 10.3.3 Slope Control

The rise and fall slope of the SN65HVD233, SN65HVD234, and SN65HVD235 driver output can be adjusted by connecting a resistor from the Rs (pin 8) to ground (GND), or to a low-level input voltage as shown in [Figure 32](#).

The slope of the driver output signal is proportional to the pin's output current. This slope control is implemented with an external resistor value of 10 kΩ to achieve a ~15 V/μs slew rate, and up to 100 kΩ to achieve a ~2.0 V/μs slew rate. A typical slew rate versus pulldown resistance graph is shown in [Figure 33](#). Typical driver output waveforms with slope control are displayed in [Figure 39](#).

**Figure 32. Slope Control/Standby Connection to a DSP**

## Feature Description (continued)

**Figure 33. HVD233 Driver Output Signal Slope vs Slope Control Resistance Value**

### 10.3.4 Standby

If a high-level input ( $> 0.75 V_{CC}$ ) is applied to  $R_S$  (pin 8), the circuit enters a low-current, *listen only* standby mode during which the driver is switched off and the receiver remains active. If using this mode to save system power while waiting for bus traffic, the local controller can monitor the R output pin for a falling edge which indicates that a dominant signal was driven onto the CAN bus. The local controller can then drive the  $R_S$  pin low to return to slope control mode or high-speed mode.

### 10.3.5 Thermal Shutdown

If the junction temperature of the device exceeds the thermal shut down threshold the device turns off the CAN driver circuits thus blocking the D pin to bus transmission path. The shutdown condition is cleared when the junction temperature drops below the thermal shutdown temperature of the device. The CAN bus pins are high impedance biased to recessive level during a thermal shutdown, and the receiver to R pin path remains operational.

## 11 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 11.1 Application Information

The CAN bus has two states during powered operation of the device; *dominant* and *recessive*. A dominant bus state is when the bus is driven differentially, corresponding to a logic low on the D and R pin. A recessive bus state is when the bus is biased to  $V_{CC} / 2$  via the high-resistance internal resistors  $R_{IN}$  and  $R_{ID}$  of the receiver, corresponding to a logic high on the D and R pins. See [Figure 34](#) and [Figure 35](#).

Figure 34. Bus States (Physical Bit Representation)

Figure 35. Simplified Recessive Common Mode Bias and Receiver

These CAN transceivers are typically used in applications with a host microprocessor or FPGA that includes the link layer portion of the CAN protocol. The different nodes on the network are typically connected through the use of a 120-Ω characteristic impedance twisted-pair cable with termination on both ends of the bus.

## 11.2 Typical Application

**Figure 36. Typical HVD233 Application**

### 11.2.1 Design Requirements

#### 11.2.1.1 Bus Loading, Length and Number of Nodes

The ISO 11898 Standard specifies up to a data rate of 1 Mbps, maximum CAN bus cable length of 40 m, maximum drop line (stub) length of 0.3 m and a maximum of 30 nodes. However, with careful network design, the system may have longer cables, longer stub lengths, and many more nodes to a bus. Many CAN organizations and standards have scaled the use of CAN for applications outside the original ISO 11898 standard. They have made system level trade-offs for data rate, cable length, and parasitic loading of the bus. Examples of some of these specifications are ARINC825, CANopen, CAN Kingdom, DeviceNet and NMEA200.

A high number of nodes requires a transceiver with high input impedance and wide common mode range such as the SN65HVD23x CAN family. ISO 11898-2 specifies the driver differential output with a 60- $\Omega$  load (two 120- $\Omega$  termination resistors in parallel) and the differential output must be greater than 1.5 V. The SN65HVD23x devices are specified to meet the 1.5-V requirement with a 60- $\Omega$  load, and additionally specified with a differential output voltage minimum of 1.2 V across a common mode range of -2 V to 7 V through a 330- $\Omega$  coupling network. This network represents the bus loading of 120 SN65HVD23x transceivers based on their minimum differential input resistance of 40 k $\Omega$ . Therefore, the SN65HVD23x supports up to 120 transceivers on a single bus segment with margin to the 1.2-V minimum differential input voltage requirement at each node.

For CAN network design, margin must be given for signal loss across the system and cabling, parasitic loadings, network imbalances, ground offsets and signal integrity thus a practical maximum number of nodes may be lower. Bus length may also be extended beyond the original ISO 11898 standard of 40 m by careful system design and data rate tradeoffs. For example, CANopen network design guidelines allow the network to be up to 1 km with changes in the termination resistance, cabling, less than 64 nodes and significantly lowered data rate.

This flexibility in CAN network design is one of the key strengths of the various extensions and additional standards that have been built on the original ISO 11898 CAN standard.

#### 11.2.1.2 CAN Termination

The ISO 11898 standard specifies the interconnect to be a twisted-pair cable (shielded or unshielded) with 120- $\Omega$  characteristic impedance ( $Z_0$ ). Resistors equal to the characteristic impedance of the line should be used to terminate both ends of the cable to prevent signal reflections. Unterminated drop lines (stubs) connecting nodes to the bus should be kept as short as possible to minimize signal reflections. The termination may be on the cable or in a node, but if nodes may be removed from the bus the termination must be carefully placed so that it is not removed from the bus.

## Typical Application (continued)

### 11.2.2 Detailed Design Procedure

Figure 37. Typical CAN Bus

Termination is typically a 120-Ω resistor at each end of the bus. If filtering and stabilization of the common mode voltage of the bus is desired, then split termination may be used (see Figure 38). Split termination uses two 60-Ω resistors with a capacitor in the middle of these resistors to ground. Split termination improves the electromagnetic emissions behavior of the network by eliminating fluctuations in the bus common mode voltages at the start and end of message transmissions.

Care should be taken in the power ratings of the termination resistors used. Typically the worst case condition would be if the system power supply was shorted across the termination resistance to ground. In most cases the current flow through the resistor in this condition would be much higher than the transceiver's current limit.

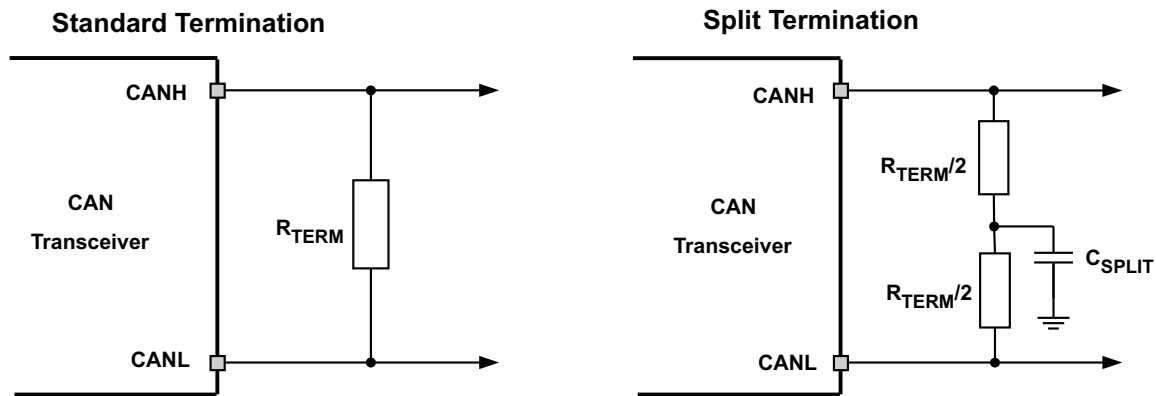

Figure 38. CAN Bus Termination Concepts

### 11.2.3 Application Curve

Figure 39 shows 3 typical output waveforms for the SN65HVD233 device with three different connections made to the  $R_S$  pin. The top waveform shows the typical differential signal when transitioning from a recessive level to a dominant level on the CAN bus with  $R_S$  tied to GND through a 0-Ω resistor. The second waveform shows the same signal for the condition with a 10-kΩ resistor tied from  $R_S$  to ground. The bottom waveform shows the typical differential signal for the case where a 100-kΩ resistor is tied from the  $R_S$  pin to ground.

## Typical Application (continued)

**Figure 39. Typical SN65HVD233 Output Waveforms With Different Slope Control Resistor Values**

## 11.3 System Example

### 11.3.1 ISO 11898 Compliance of SN65HVD23x Family of 3.3-V CAN Transceivers

#### 11.3.1.1 Introduction

Many users value the low power consumption of operating their CAN transceivers from a 3.3-V supply. However, some are concerned about the interoperability with 5 V supplied transceivers on the same bus. This report analyzes this situation to address those concerns.

#### 11.3.1.2 Differential Signal

CAN is a differential bus where complementary signals are sent over two wires and the voltage difference between the two wires defines the logical state of the bus. The differential CAN receiver monitors this voltage difference and outputs the bus state with a single ended logic level output signal.

## System Example (continued)

**Figure 40. Typical SN65HVD230 Differential Output Voltage Waveform**

The CAN driver creates the differential voltage between CANH and CANL in the dominant state. The dominant differential output of the SN65HVD23x is greater than 1.5 V and less than 3 V across a 60 ohm load as defined by the ISO 11898 standard. These are the same limiting values for 5 V supplied CAN transceivers. The bus termination resistors drive the recessive bus state and not the CAN driver.

A CAN receiver is required to output a recessive state when less than 500 mV of differential voltage exists on the bus, and a dominant state when more than 900 mV of differential voltage exists on the bus. The CAN receiver must do this with common-mode input voltages from –2 V to 7 V. The SN65HVD23x family receivers meet these same input specifications as 5 V supplied receivers.

### 11.3.1.3 Common-Mode Signal

A common-mode signal is an average voltage of the two signal wires that the differential receiver rejects. The common-mode signal comes from the CAN driver, ground noise, and coupled bus noise. Since the bias voltage of the recessive state of the device is dependent on  $V_{CC}$ , any noise present or variation of  $V_{CC}$  will have an effect on this bias voltage seen by the bus. The SN65HVD23x family has the recessive bias voltage set higher than  $0.5 \cdot V_{CC}$  to comply with the ISO 11898-2 CAN standard. The caveat to this is that the common mode voltage will drop by a couple hundred millivolts when driving a dominant bit on the bus. This means that there is a common mode shift between the dominant bit and recessive bit states of the device. While this is not ideal, this small variation in the driver common-mode output is rejected by differential receivers and does not effect data, signal noise margins or error rates.

### 11.3.1.4 Interoperability of 3.3-V CAN in 5-V CAN Systems

The 3.3-V supplied SN65HVD23x family of CAN transceivers are fully compatible with 5-V CAN transceivers. The differential output voltage is the same, the recessive common mode output bias is the same, and the receivers have the same input specifications. The only slight difference is in the dominant common mode output voltage which is a couple hundred millivolts lower for 3.3-V CAN transceiver than 5-V supplied transceiver.

To help ensure the widest interoperability possible, the SN65HVD23x family has successfully passed the internationally recognized GIFT/ICT conformance and interoperability testing for CAN transceivers. Electrical interoperability does not always assure interchangeability however. Most implementers of CAN buses recognize that ISO 11898 does not sufficiently specify the electrical layer and that strict standard compliance alone does not ensure full interchangeability. This comes only with thorough equipment testing.

## 12 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, each supply should be decoupled with a 100-nF ceramic capacitor located as close to the  $V_{CC}$  supply pins as possible. The TPS76333 is a linear voltage regulator suitable for the 3.3 V supply.

## 13 Layout

### 13.1 Layout Guidelines

In order for the PCB design to be successful, start with design of the protection and filtering circuitry. Because ESD and EFT transients have a wide frequency bandwidth from approximately 3 MHz to 3 GHz, high frequency layout techniques must be applied during PCB design. On chip IEC ESD protection is good for laboratory and portable equipment but is usually not sufficient for EFT and surge transients occurring in industrial environments. Therefore robust and reliable bus node design requires the use of external transient protection devices at the bus connectors. Placement at the connector also prevents these harsh transient events from propagating further into the PCB and system.

Use  $V_{CC}$  and ground planes to provide low inductance.

#### NOTE

High frequency current follows the path of least inductance and not the path of least resistance.

Design the bus protection components in the direction of the signal path. Do not force the transient current to divert from the signal path to reach the protection device.

An example placement of the Transient Voltage Suppression (TVS) device indicated as D1 (either bi-directional diode or varistor solution) and bus filter capacitors C8 and C9 are shown in [Figure 41](#).

**The bus transient protection and filtering components should be placed as close to the bus connector, J1, as possible. This prevents transients, ESD and noise from penetrating onto the board and disturbing other devices.**

Bus termination: [Figure 41](#) shows split termination. This is where the termination is split into two resistors, R5 and R6, with the center or split tap of the termination connected to ground via capacitor C7. Split termination provides common mode filtering for the bus. When termination is placed on the board instead of directly on the bus, care must be taken to ensure the terminating node is not removed from the bus as this will cause signal integrity issues of the bus is not properly terminated on both ends. See the application section for information on power ratings needed for the termination resistor(s).

Bypass and bulk capacitors should be placed as close as possible to the supply pins of transceiver, examples C2, C3 ( $V_{CC}$ ).

Use at least two vias for  $V_{CC}$  and ground connections of bypass capacitors and protection devices to minimize trace and via inductance.

To limit current of digital lines, serial resistors may be used. Examples are R1, R2, R3 and R4.

To filter noise on the digital IO lines, a capacitor may be used close to the input side of the IO as shown by C1 and C4.

Since the internal pullup and pulldown biasing of the device is weak for floating pins, an external 1-k $\Omega$  to 10-k $\Omega$  pullup or pulldown resistor should be used to bias the state of the pin more strongly against noise during transient events.

Pin 1: If an open drain host processor is used to drive the D pin of the device an external pull-up resistor between 1 k $\Omega$  and 10 k $\Omega$  and  $V_{CC}$  should be used to drive the recessive input state of the device.

Pin 8: is shown assuming the mode pin, RS, will be used. If the device will only be used in normal mode or slope control mode, R3 is not needed and the pads of C4 could be used for the pulldown resistor to GND.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF SN65HVD233, SN65HVD234, SN65HVD235 :**

- Automotive: [SN65HVD233-Q1](#), [SN65HVD234-Q1](#), [SN65HVD235-Q1](#)
- Enhanced Product: [SN65HVD233-EP](#)

**NOTE: Qualified Version Definitions:**

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects
- Enhanced Product - Supports Defense, Aerospace and Medical Applications

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - $\triangle C$  Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
  - $\triangle D$  Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
  - E. Reference JEDEC MS-012 variation AA.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
